## **Introduction to Information Theory, Fall 2021**

## Homework problem set #2

due Nov 14, 2021

**Rules:** Always explain your solutions carefully. Please hand in the assignment in groups on Canvas. In the werkcollege the TAs can tell you more about how this works.

1. Entropy and Huffman codes (1 point): Consider the following probability distribution:

- (a) Compute H(P) to one digit after the decimal point (or better). You can use a computer.
- (b) Construct a Huffman code  $\mathcal{C}$  for P and compute the average length per symbol  $L(\mathcal{C}, P)$ .
- 2. **Subadditivity of entropy (1 point):** The goal of this problem is to prove the following: For any two random variables X, Y with an *arbitrary* joint distribution P(x, y), it holds that

$$H(X,Y) \leqslant H(X) + H(Y). \tag{1}$$

This inequality is known as the *subadditivity* property of the entropy.

(a) Verify the following identity, where  $P(x) = \sum_{y} P(x,y)$  and  $P(y) = \sum_{x} P(x,y)$  denote the marginal distributions (as always):

$$H(X) + H(Y) - H(X,Y) = \sum_{x,y} P(x,y) \log \frac{P(x,y)}{P(x)P(y)}$$

(b) Use part (a) together with an inequality you know from class to prove inequality (1).

Optional problem: Show that ineq. (1) holds with equality precisely when X and Y are independent.

3. Huffman compression (1 point):

This week you will implement Huffman's algorithm. To get started, open the Python note-book at https://colab.research.google.com/github/amsqi/iit21-homework/blob/master/02-homework.ipynb and follow the instructions.

As last week, please submit both the notebook **and** a PDF printout, or provide a link to your solution on Colab. You can achieve the maximum score if your solution produces the correct output. We will only have a closer look at your code in case of problems.

This programming problem may be a bit more difficult than last week's, so we will grade it gently. We also added some optional challenge problems in the notebook. Can you beat zlib? ©
