

Introduction to Information Theory, Fall 2021

Homework problem set #1

due Nov 7, 2021

Rules: Always explain your solutions carefully. Please hand in the assignment in groups on Canvas. In the werkcollege the TAs can tell you more about how this works.

1. **Binary symmetric channel (1 point):** Recall the binary symmetric channel from class, which transmits a given bit correctly with probability $1 - f$ and flips the bit with probability f :

Suppose we communicate a random bit over this channel by using the repetition code R_3 . We can model this situation by three random variables: S is the message (the random bit) that we wish to communicate, $X = X_1X_2X_3$ is the codeword that we send over the channel (bit by bit), and $Y = Y_1Y_2Y_3$ is the signal that we receive on the other side. For concreteness, suppose S is 0 with probability $p = 1/4$, and the probability of flipping the bit is $f = 1/3$.

- Make a table that contains the joint probability distribution of S and Y , as well as their marginal distributions. Your table should look like the one that we made in Lecture 2.
 - Are the first two bits of Y independent from each other?
 - Suppose you receive 010 . What are the optimal decoding and the probability of error?
2. **Binary asymmetric channel (1 point):** Imagine a channel that always transmits 0 correctly, but which flips 1 with probability p . You can visualize this as follows:

Suppose that you would like to communicate a uniformly random bit by using this channel.

- When using the channel directly, what is the probability that the bit arrives flipped?
 - Now encode your bit using the repetition code R_3 . What is the optimal decoder? What is the probability of error when using the optimal decoder?
3.  **Simulating the repetition code (1 point):**

In this problem, you will simulate the *binary symmetric channel* and the *repetition code R_3* discussed in class and above. Your goal is to obtain a result similar to Figure 1.11 in MacKay's book. To get started, open the Python notebook at <https://colab.research.google.com/github/amsqi/iit21-homework/blob/master/01-homework.ipynb> and follow the instructions. We tried to make everything self-explanatory, but please do not hesitate to ask if anything is unclear!

Please submit both the notebook (*File* \rightarrow *Download .ipynb*) **and** a PDF printout (*File* \rightarrow *Print*) of your solution. You can achieve the maximum score if your code produces the correct output – we will only have a closer look if it does not.
